### Lab composite for a lifelike appearance

**SR Nexco Paste, the new, purely light-curing lab composite from Ivoclar Vivadent, embodies esthetics, shade tolerance and versatility. The composite contains micro-opal fillers, which provide for natural-looking opalescence and translucency.**

Ivoclar Vivadent has developed SR Nexco Paste, a composite for the dental lab applied in the layering technique and polymerized purely with light. This composite material is used to veneer framework-based and framework-free prosthetic restorations: The indication range of this composite stretches from inlays, onlays and crowns to bridges and implant-supported as well as combination dentures. Customary light units can be used to polymerize this material.

#### **Lifelike restorations**

SR Nexco restorations exhibit a lifelike appearance due to the micro-opal fillers. In addition, the restorations feature high shade stability and are therefore durable. Dental technicians will find the layer thickness tolerance (between 0.6 and 1.5 mm) particularly useful when fabricating SR Nexco restorations. Therefore, a precise and consistent shade can always be achieved. The comprehensive shade range of SR Nexco Paste composite also comes in very handy when fabricating artificial gingiva, for instance in the case of implant-supported restorations.

#### **A coordinated system**

SR Nexco forms part of a comprehensive prosthetic solution from Ivoclar Vivadent. In conjunction with the compatible alloys, the SR Phonares II denture teeth and the IvoBase denture base material, SR Nexco Paste affords users numerous application possibilities.

SR Phonares® and IvoBase® are registered trademarks of Ivoclar Vivadent AG.
