One working step

IPS InLine One is a modern one-layer metal-ceramic for quick and efficient layering on the most popular ceramic alloys.

With the IPS InLine One one-layer metal-ceramic from Ivoclar Vivadent, dental technicians can achieve their layering in one single working step. This offers a wealth of advantages: The time-savings are considerable and the material consumption is clearly reduced. Moreover, the layering materials are easy to apply and do not require any special knowledge on layering.

Not surprisingly, the layering materials go by the name of IPS InLine One Dentcisal and represent a combination of dentin and incisal materials. Chroma and translucency are coordinated with each other in a balanced way and thus provide the material with ideal optical properties. Therefore, IPS InLine One restorations demonstrate a consistent, true-to-nature shade. The veneer can then be individually characterized using the existing Shade and Stains materials of the IPS InLine system. IPS InLine is optimally coordinated with all Ivoclar Vivadent alloys. It is particularly suitable for the Colado CC cobalt-chromium alloy for especially economical restorations.

Compatible with each other

The IPS InLine metal-ceramic system can be processed using various techniques. They include the one-layer technique (IPS InLine One), conventional layering (IPS InLine) or the Press-on-Metal technique (IPS InLine PoM). The IPS InLine system gives you the choice of various compatible system components that can be applied with all three techniques. For example, the same opaquer is used for all three techniques. In this way, the metal-ceramic system remains slim and still offers flexibility of application.

IPS InLineOne is available immediately throughout the world.
