Efficient contouring due to non-stick surface

OptraSculpt Pad is a new modelling instrument from Ivoclar Vivadent with foam pad attachments designed for the non-stick adaptation of composite materials. This instrument allows composite filling materials to be shaped without leaving unwanted marks. Smooth and even restoration surfaces can be achieved with ease. Reference scales on the instrument handle assist in the creation of the desired esthetic results.

OptraSculpt Pad is a modelling instrument with special foam pad attachments, which enable the efficient, non-stick application of composite filling materials. It is particularly suited for the placement of Class III, IV and V restorations and direct veneers.

Non-stick shaping and contouring
The non-stick attachments of OptraSculpt Pad enable composite filling materials to be shaped and contoured with ease, without leaving any unwanted marks. Fillings with smooth and even surfaces can be achieved with utmost efficiency.

Creating smooth and even surfaces
Natural-looking results are easy to accomplish in anterior and cervical restorations due to the special material of the pad attachments. The highly flexible synthetic foam material optimally adapts to the tooth shape and allows the filling to be contoured smoothly.

Professional esthetic results
Reference scales on the instrument handle assist in the creation of esthetically pleasing, anatomically correct anterior restorations. The markings allow the clinical situation to be compared with the ideal average tooth width proportion and angular alignments in the upper anterior dentition.
