For a plus in pink esthetics

With Gingiva Solution, dental technicians can now benefit from a new overarching system for the design of prosthetic gingival reconstructions in removable and fixed restorations.

True-to-nature reconstructions of the gingival portions and pink esthetics play an increasingly important role in the fabrication of extensive restorations. Those gingival areas that will be replaced should be accurately reconstructed in line with the specific needs of the individual patient. To enable dental technicians to fulfil these requirements, Ivoclar Vivadent has developed a new system for the reconstruction of prosthetic gingiva: Gingiva Solution.

The system in detail

The system shows a method to achieve natural-looking gingival reconstructions by adding various (intensive) gingival shades onto a basic gingival material. The method also recommends using the same layering schematic for composite and ceramic materials and combining materials and material systems that are coordinated with each other, such as SR Nexco, IvoBase, IPS e.max, IPS InLine and IPS d.SIGN. In addition, the system includes a number of guidelines, illustrating how the individual products are applied to create lifelike gingival esthetics.

SR Nexco®, IvoBase®, IPS e.max®, IPS InLine® and IPS d.SIGN® are registered trademarks of Ivoclar Vivadent.
