

## Press Release

### Silamat® S6 – mixing with style

#### Form and function combined in an attractive design

Schaan, 16. May 2008 – **In addition to functionality, an attractive design has become an important criterion for many dentists when they buy a new apparatus for their practice. With the universal mixing device Silamat S6, Ivoclar Vivadent is setting a new standard as regards design, functionality and time-tested quality.**

The mixing device has been designed by the internationally renowned and prize-winning designer Richard Amiel, who has also been responsible for the appearance of the successful polymerization light bluephase®. He prefers round but clear shapes. His style is also reflected in the design of the Silamat S6. Thanks to the rounded shapes and the removable cover the unit can be cleaned easily.

“It is important to me that dentists and dental assistants like to work with the unit. Practices are becoming more modern and design-oriented. However, many units still look old-fashioned. Why not design a mixing device that ideally suits the modern practice?” These were the thoughts that inspired Richard Amiel to design the Silamat S6.

The Silamat S6 not only features a convincing design: The time-tested Silamat® technology leaves nothing to be desired as far as functionality is concerned. The patented mixing mechanism with a figure-eight mixing pattern helps to achieve homogeneous mixing results. Various types of mixing and injection capsules including types which are too large for conventional mixing devices can be used. The capsules can be loaded with only one swift hand movement. Simply set the desired mixing time in seconds and you’re done!

The development of the Silamat S6 once again proves that Ivoclar Vivadent’s company philosophy “Passion – Vision – Innovation“ is actively pursued.
